

Software Testing Scenarios Report

Unit, Integration, System, Acceptance, Alpha & Beta Testing Exercises

1. Write a unit test scenario for the 'Add to Cart' function in a shopping app like Flipkart, focusing on what should be tested at the smallest code level (e.g., adding an item updates the cart count).

ANS

Test Case ID	UT_01
Test Scenario	Add a product to the cart
Test Type	Unit Testing
Precondition	Cart is empty and product is available
Test Steps	1. Select a product. 2. Call the addToCart () function. 3. Check cart count.
Expected Result	Product is added to the cart and cart count increases from 0 to 1.
Actual Result	Product added successfully and cart count updated to 1.
Status	Pass

2. Describe an integration testing scenario for a payment flow in a food delivery app like Zomato, where you need to test the interaction between the order placement module and the payment gateway.

ANS

Test Case ID	IT_01
Test Scenario	Place an order and make payment successfully

Test Type	Integration Testing
Precondition	User is logged in and food items are added to the cart
Test Steps	1. Select food items and proceed to checkout. 2. Click Place Order. 3. Choose a payment method (UPI/Card/Net Banking). 4. Complete the payment through the payment gateway. 5. Return to the app after payment.
Expected Result	Payment gateway should send a success response to the Order Module, and the order should be confirmed successfully.
Actual Result	Order is placed successfully and confirmation message is displayed.
Status	Pass

3. Write a system testing scenario for the ticket booking process in an app like BookMyShow, covering the entire end-to-end flow from searching for a movie to receiving a booking confirmation.

ANS

Test Case ID	ST_01
Test Scenario	End-to-End Movie Ticket Booking
Test Type	System Testing
Precondition	User is registered and logged into the app
Test Steps	1. Open the BookMyShow app. 2. Search for a movie. 3. Select the desired movie. 4. Choose a theater and show time. 5. Select available seats. 6. Proceed to payment. 7. Complete the payment successfully. 8. Check booking confirmation screen, email, or SMS.

Expected Result	The ticket should be booked successfully, seats should be reserved, payment should be processed, and a booking confirmation should be sent to the user.
Actual Result	Ticket booked successfully and confirmation received.
Status	Pass

4. Create an acceptance testing (UAT/SAT) scenario for a new playlist feature in a music app like Spotify, focusing on how a real user would verify that the feature meets their needs.

ANS

Scenario Name: Verify Playlist Creation and Usage

Objective: To check whether a user can easily create, manage, and play a playlist according to their needs.

Pre-Condition:

- User is logged into the music app.
- User has an active internet connection.

Test Steps:

Step No.	Action	Expected Result
1	Open the music app.	App opens successfully.
2	Go to the "Your Library" section.	Library page is displayed.
3	Click on "Create Playlist".	A new playlist creation screen appears.
4	Enter playlist name "My Favorites" and save.	Playlist is created successfully.
5	Search for songs and add 5 songs to the playlist.	Songs are added to the playlist.
6	Open the playlist and play songs.	Songs play in the correct order.
7	Remove one song from the playlist.	Selected song is removed successfully.
8	Rename the playlist.	Playlist name is updated.

Step No.	Action	Expected Result
9	Close and reopen the app.	Playlist and changes are saved.

Expected Outcome: The user can create, edit, save, and play a playlist without any issues. All changes should remain saved after reopening the app.

UAT Result:  **Pass** (if all expected results are achieved)

5. Write a scenario for either alpha or beta testing for a new group chat feature in a messaging app like WhatsApp, specifying who would perform the test and what feedback is expected.

Hint: Think about internal employees vs. real users and the types of issues they might report.

ANS

Alpha Testing Scenario – WhatsApp Group Chat Feature

Scenario: A new Group Chat feature is developed in a messaging app like WhatsApp. Before releasing it to the public, the feature is tested by the company's internal employees (QA team, developers, and product team).

Who Performs the Test?

- Internal Employees
- QA Testers
- Developers
- Product Team

Testing Activities:

1. Create a new group.
2. Add and remove members.
3. Send text messages, images, and videos.
4. Check group notifications.
5. Verify group admin permissions.

Expected Feedback:

- Group creation is slow.

- Notifications are not received properly.
- Admin cannot remove members in some cases.
- App crashes when sending large files.

Purpose: Find and fix bugs before releasing the feature to real users.

Beta Testing Scenario – WhatsApp Group Chat Feature

Scenario: After Alpha Testing is completed, the new Group Chat feature is released to a limited number of real users for Beta Testing.

Who Performs the Test?

- Real Users (Selected Customers)
- Beta Program Participants

Testing Activities:

1. Create groups with friends and family.
2. Chat daily in groups.
3. Share photos, videos, and documents.
4. Use the feature on different devices and networks.
5. Test the feature in real-life situations.

Expected Feedback:

- Feature is easy or difficult to use.
- Group notifications are too frequent.
- UI design can be improved.
- Performance issues on older phones.
- Suggestions for new features (polls, reactions, etc.).

Purpose: Collect real user feedback and improve user experience before the final release.
